Global Temperature Increase

[Interactive Map](#) | [Data Explorer](#)

Global temperature increase is a significant concern for many people. It is caused by the release of greenhouse gases into the atmosphere. These gases trap heat from the sun, leading to a rise in global temperatures. This rise in temperature can lead to a variety of problems, including more frequent and severe weather events, rising sea levels, and the loss of biodiversity. It is important that we take action to reduce the amount of greenhouse gases we are releasing into the atmosphere. This can be done by using renewable energy, reducing our carbon footprint, and supporting policies that aim to reduce global warming.
